

Eve™ CCHD Newborn Screening Application

Eve combines clinically proven Masimo SET® Measure-through Motion and Low Perfusion™ pulse oximetry with step-by-step guided workflows to standardize Critical Congenital Heart Disease (CCHD) screenings

Eve simplifies the CCHD screening process, per an established protocol¹, by providing visual instructions, animations, an automatic synchronization algorithm, and a detailed, easy-to-interpret display of screening results

Streamlined Solution for CCHD Screening with Masimo SET® Pulse Oximetry

On-screen animations provide visual guidance to assist clinicians through the screening process, including sensor placement.

Automated calculation, with an easy-to-interpret results screen, may reduce manual calculation errors.

Customizable settings allow clinicians to incorporate perfusion index (Pi) measurement, which may increase sensitivity to detection of CCHD.^{2,3}

Electronic medical record (EMR) integration via Masimo Patient SafetyNet™* or Iris® Gateway facilitates workflow and may help reduce reporting errors.

Even when used on the Root platform along with the Masimo SET® Module and Radical-7®, allows clinicians to obtain simultaneous measurements from two application sites using one convenient display.

Eve application is also available on the Rad-97® and Radical-7® Pulse CO-Oximeters®

Step-By-Step Instruction Improves Consistency and Workflow Efficiency

STEP 1

Sensor Placement on Right Hand

STEP 2

Sensor Placement on Either Foot

STEP 3

Screening Results

Animated instructions guide proper site selection
